Exhibit 14

Montana Greater Sage-grouse population estimates and associated uncertainty, and the number of known breeding sites (called leks) are presented in this report in compliance with MCA 87-1-201(1)(11), as amended in 2017.

## **Population Estimates**

Montana Fish, Wildlife and Parks (FWP) worked with Dr. Paul Lukacs, University of Montana, to estimate sage-grouse population numbers based on counts of displaying males at leks using N-mixture models. Results are presented in Figure 1 and Table 1. This modeling approach is a robust analytical method for estimating population size and trend over time for species like sage-grouse that congregate at discrete breeding sites (McCaffrey et al. 2016). Although FWP maintains a database of male counts at leks that date back to 1952, only data from 2002 onward could be used with this modeling approach. To convert the estimated number of males to a population estimate, we multiplied the estimate by an estimated female to male ratio.

### Some Caveats...

All models are an approximation, not truth, and rely on certain assumptions. The assumptions that were made in the development of these population estimates include:

- FWP does not count females but can estimate the number of females based on an assumed sex ratio. We used an average ratio of 2.45:1 females to males based on published literature (Knick and Connelly 2011). While we accounted for the uncertainty in this published ratio in our overall confidence intervals, annual population numbers may be larger or smaller than estimated depending upon the actual ratio in each year.
- Only data from known leks were used in the calculations. This could lead to under-estimating the true population if there were a sizeable number of unknown leks.
- Models assumed each male visited one lek. This could lead to over-estimating the true population if individual males visited and were counted at multiple leks.
- Models assumed each male was detected independently. This could lead to under-estimating the true population if detection of some individuals was dependent upon detection of other individuals.

Sage-grouse population numbers oscillate over a period of 8 – 10 years across large scales (Fedy and Doherty 2011). The lower numbers estimated for Montana's population in the years 2008 - 2014 relative to preceding or subsequent years are likely due, in part, to natural population fluctuations. It is not appropriate to make decisions based on estimates from a single or few years without putting them in the context of a longer timeframe. It is also important to recognize that count data are collected in spring, when population numbers are likely at their lowest. Fall population numbers can be considerably higher in years with good reproduction.

There are other analytical models that have utility for estimating population size and trends, such as Integrated Population Models. However, these models require additional demographic information, such as recruitment data, that are currently unavailable statewide. FWP may explore additional modeling techniques in the future as new data become available.

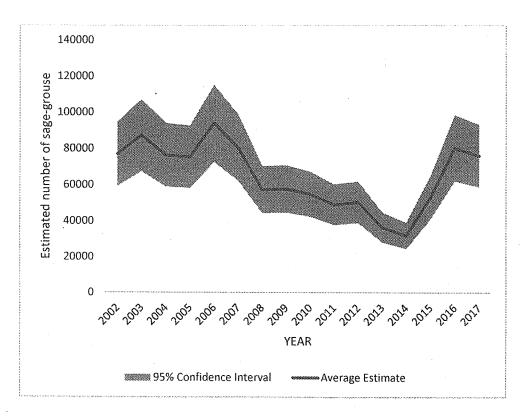

Figure 1. Graphical representation of Greater Sage-grouse population estimates in Montana, 2002 - 2017. In general terms, confidence intervals are the range of values that describe the uncertainty associated with the population estimate.

Table 1. Numerical estimates of sage-grouse numbers and associated uncertainty from *N*-mixture models in Montana, 2002-2017.

| Year | Population | Standard | 95% Confidence Interval |             |  |
|------|------------|----------|-------------------------|-------------|--|
|      | Estimate   | Error    | Lower Bound             | Upper Bound |  |
|      |            |          |                         |             |  |
| 2002 | 76989      | 9005     | 59339                   | 94639       |  |
| 2003 | 87303      | 10117    | 67474                   | 107132      |  |

| 2009 | 57749      | 6682     | 44652                   | 70846       |  |
| 2010 | 54873      | 6341     | 42445                   | 67301       |  |
| 2011 | 49086      | 5720     | 37875                   | 60297       |  |
| 2012 | 50490      | 5863     | 38999                   | 61981       |  |
| 2013 | 36400      | 4217     | 28135                   | 44665       |  |
| 2014 | 31757      | 3696     | 24513                   | 39001       |  |
| 2015 | 53116      | 6138     | 41086                   | 65146       |  |
| 2016 | 80245      | 9276     | 62064                   | 98426       |  |
| 2017 | 75979      | 8775     | 58780                   | 93178       |  |

#### **Number of Leks**

FWP maintains a spatial database of Greater Sage-grouse leks, summarized by activity status in Table 2. FWP staff are continually working to confirm and record new lek locations and update status. The number of known confirmed active leks in 2017 is almost double the number in 2002, in large part because of increased survey effort by FWP staff.

Table 2. Number of known Greater Sage-grouse leks in Montana by activity status, 2002 – 2017.

| Year | Confirmed<br>Active | Confirmed<br>Inactive | Confirmed<br>Extirpated | Never Confirmed<br>Active | Unconfirmed | Total |
|------|---------------------|-----------------------|-------------------------|---------------------------|-------------|-------|
| 2002 | 550                 | 79                    | 17                      | 29                        | 512         | 1187  |
| 2003 | 615                 | 84                    | 17                      | 47                        | 519         | 1282  |
| 2004 | 651                 | 88                    | 19                      | 56                        | 531         | 1345  |
| 2005 | 676                 | 94                    | 19                      | 64                        | 543         | 1396  |
| 2006 | 719                 | 96                    | 19                      | 67                        | 604         | 1505  |
| 2007 | 754 <sup>.</sup>    | . 98                  | 20                      | 72                        | 630         | 1574  |
| 2008 | 811                 | 100                   | 22                      | 75                        | 590         | 1598  |

## **Status Definitions:**

Confirmed Active - Data supports existence of lek. Supporting data defined as 1 year with 2 or more males lekking on site followed by evidence of lekking (Birds - male, female or unclassified; -OR- Sign - vegetation trampling, feathers, or droppings) within 10 years of that observation.

Confirmed Inactive - A Confirmed Active lek with no evidence of lekking (Birds - male, female or unclassified; -OR- Sign - vegetation trampling, feathers, or droppings) for the last 10 years. Requires a minimum of 3 survey years with no evidence of lekking during a 10-year period. Reinstating Confirmed Active status requires meeting the supporting data requirements.

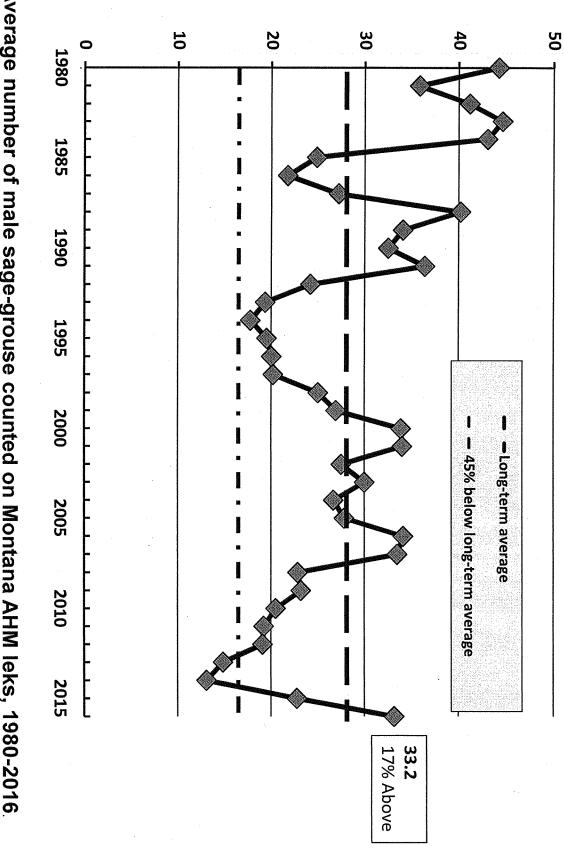

Confirmed Extirpated - Habitat changes have caused birds to permanently abandon a lek (e.g., plowing, urban development, overhead power line) as determined by the biologists monitoring the lek.

Never confirmed active – An Unconfirmed (UC) lek that was never confirmed active. Requires 3 or more survey years with no evidence of lekking (Birds - male, female or unclassified; -OR- Sign - vegetation trampling, feathers, or droppings) over any period of time.

Unconfirmed - Possible lek. Grouse activity documented. Data insufficient to classify as Confirmed Active status.
